Continuation of 11. does NOT place the application in condition for allowance because: Regarding claims 1 and 12, Applicant argues that Westerlund et al. perform the disclosed method in an encoder and not in a decoder (p. 9). Furthermore, Applicant argues that an original voice input signal does not comprise a reference signal based on a received communication.

The Examiner cannot concur with the Applicant. Westerlund et al. disclose adjusting the operational parameters of a decoder (Col. 2, Lines 26-30). In the method disclosed by Westerlund et al. a decoder is included in the encoding side as required by the analysis-by-synthesis procedure. The input speech, which is a received communication segmented into frames, serves as a reference signal for the analysis-by-synthesis procedure performed within the method disclosed by Westerlund et al.. The analysis-by-synthesis procedure, as well known in the art, involves the comparison of a reference signal to an iteratively produced signal with the objective of minimizing the difference between the two, resulting in the finding of a combination of parameters that produces the signal that minimizes the aforementioned difference. Therefore the claims stay rejected.
